Of the seven or eight that I have read, this is the single best most sensible book. Easy to read, to "connects the dots" and makes it clear just how tough urban and surban survival is going to be--imagine Baghdad at home.The author has really knocked the ball out of the park with common sense. This is not a book that states the obvious as much as it is a book that really drives home the

importance of obtaining water, treating water, creating latrines and making best use of gray water, keeping food cool, heating for fuel (with a dramatic savings achievable for short-term fuel use augmented by hot box "sitting"), and then ending with lighting and heat. The layout of the book is first-rate, the diagrams are superb and easy to understand, and the practical list of tools and supplies needed for sustenance survival is explicit, not over-stated, and just plain serious. Absolutely a great book and a serious contribution to the good of any community. We won't run totally out of oil-the most likely scenario is short to medium term supply/price crisis. This is an excellent book for that temporary disruption or transition that peak oil fanatics say is just around the corner. This book is the best illustrated I have seen on the topics it covers. It is also short and to the point. Why read 200 pages when 100 will cover it? This book covers water collection and filtration, heating and lighting, cooking and food storage. The techniques and tools presented in this book are simple, cheap, relatively easy, and do not require a machine shop to make or do. Very few people will be prepared for some crises that will come down the pike; this book will help those people make do with what they have.

Efforts like [PEAK OIL SURVIVAL] will serve as lifeboats. Generally speaking, it's better to build a lifeboat before the ship starts to list precariously, rather than wait for universal acknowledgment that it is in fact sinking.
